

IUPAC Task Group on Atmospheric Chemical Kinetic Data Evaluation – Data Sheet NO₃_VOC16

Website: <http://iupac.pole-ether.fr>. See website for latest evaluated data. Data sheets can be downloaded for personal use only and must not be retransmitted or disseminated either electronically or in hardcopy without explicit written permission.

This data sheet updated: 12th December 2007 (with no revision of the preferred values).

NO₃ + CH₂=C(CH₃)CHO (methacrolein) → products

Rate coefficient data

<i>k</i> /cm ³ molecule ⁻¹ s ⁻¹	Temp./K	Reference	Technique/ Comments
<i>Absolute Rate Coefficients</i>			
≤8 x 10 ⁻¹⁵	298	Rudich et al., 1996	F-A (a)
<i>Relative Rate Coefficients</i>			
(4.46 ± 0.58) x 10 ⁻¹⁵	296 ± 2	Kwok et al., 1996	RR (b)
(3.08 ± 0.18) x 10 ⁻¹⁵	298 ± 2	Chew et al., 1998	RR (c)
(3.50 ± 0.15) x 10 ⁻¹⁵	298 ± 2	Chew et al., 1998	RR (d)
(3.72 ± 0.47) x 10 ⁻¹⁵	296 ± 2	Canosa-Mas et al., 1999	RR (e)

Comments

- NO₃ radicals were generated by thermal decomposition of N₂O₅ in a flow system at total pressures of 1.5-3 Torr (2-4 mbar), and monitored by absorption at 661.9 nm.
- Relative rate method carried out at atmospheric pressure of air. NO₃ radicals were generated by thermal decomposition of N₂O₅. The concentrations of methacrolein and propene (the reference compound) were measured by GC. The measured rate coefficient ratio of $k(\text{NO}_3 + \text{methacrolein})/k(\text{NO}_3 + \text{propene}) = 0.48 \pm 0.06$ is placed on an absolute basis by use of a rate coefficient of $k(\text{NO}_3 + \text{propene}) = 9.29 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (IUPAC, current recommendation).
- Relative rate method carried out at atmospheric pressure of air. NO₃ radicals were generated by thermal decomposition of N₂O₅. The concentrations of methacrolein and propene (the reference compound) were measured by GC. The measured rate coefficient ratio of $k(\text{NO}_3 + \text{methacrolein})/k(\text{NO}_3 + \text{propene}) = 0.324 \pm 0.017$ is placed on an absolute basis by use of a rate coefficient of $k(\text{NO}_3 + \text{propene}) = 9.5 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (IUPAC, current recommendation).
- Relative rate method carried out at atmospheric pressure of air. NO₃ radicals were generated by thermal decomposition of N₂O₅. The concentrations of methacrolein and 1-butene (the reference compound) were measured by GC. The measured rate coefficient ratio of $k(\text{NO}_3 + \text{methacrolein})/k(\text{NO}_3 + \text{1-butene}) = 0.259 \pm 0.011$ is placed on an absolute basis by use of a rate coefficient of $k(\text{NO}_3 + \text{1-butene}) = 1.35 \times 10^{-14} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K (Atkinson, 1997).
- Relative rate method carried out at atmospheric pressure of N₂. NO₃ radicals were generated by thermal decomposition of N₂O₅. The concentrations of methacrolein and propene (the reference compound) were measured by GC. The measured rate coefficient ratio of $k(\text{NO}_3 + \text{methacrolein})/k(\text{NO}_3 + \text{propene}) = 0.40 \pm 0.05$ is placed on an absolute basis by use of a rate coefficient of $k(\text{NO}_3 + \text{propene}) = 9.29 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 296 K (IUPAC, current recommendation).

recommendation). An absolute rate coefficient of $(9.6 \pm 2.0) \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ was also measured at $300 \pm 7 \text{ K}$ using a discharge flow system with LIF detection of NO_3 radicals.

Preferred Values

$k = 3.4 \times 10^{-15} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$ at 298 K.

Reliability

$\Delta \log k = \pm 0.15$ at 298 K.

Comments on Preferred Values

The 298 K preferred value is the average of the relative rate coefficients of Chew et al. (1998) (which supersedes the earlier and less extensive study of Kwok et al., 1996) and Canosa-Mas et al. (1999), which are in good agreement and are consistent with the upper limit reported by Rudich et al. (1996).

The room temperature rate coefficient is similar to that for reaction of NO_3 radicals with acetaldehyde (IUPAC, 2007), and the reaction is expected to proceed mainly by H-atom abstraction from the CHO group.
