Quantum yields for ClNO photolysis at 298 K

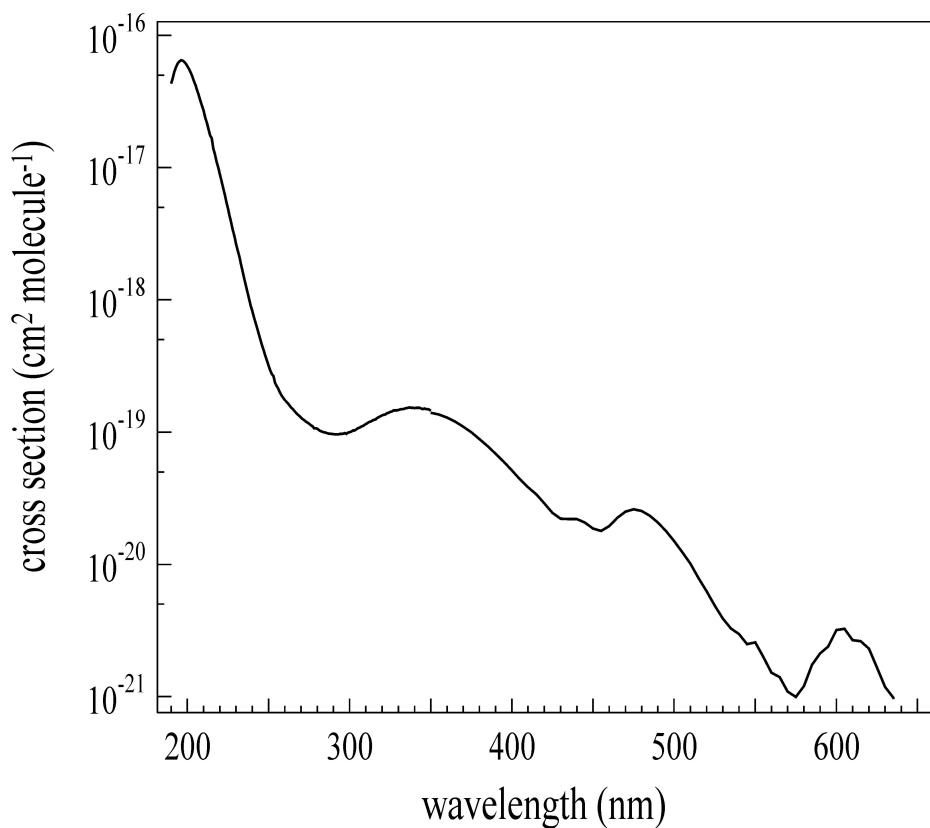

$\phi = 1.0$ over the entire wavelength range.

Comments on Preferred Values

The preferred values of the absorption cross sections at 298 K for the wavelength range 190-350 nm are the values reported by Tyndall et al. (1987) and for the longer wavelengths are the values reported in Roehl et al. (1992). Roehl et al. (1992) determined values over the wavelength range 350-650 nm and the temperature range 223-343 K. Earlier results are discussed by Sander et al., 2006. The preferred quantum yield values are taken from Calvert and Pitts 1966). Relative yields of the spin-orbit states of $\text{Cl}({}^2\Pi_{3/2})$ and $\text{Cl}({}^2\Pi_{1/2})$ have been measured by Felder and Morley (1999) and Skorobogatov et al. (1996).
