

# IUPAC Task Group on Atmospheric Chemical Kinetic Data Evaluation – Data Sheet ROO\_7

Website: <http://iupac.pole-ether.fr>. See website for latest evaluated data. Data sheets can be downloaded for personal use only and must not be retransmitted or disseminated either electronically or in hardcopy without explicit written permission.

This data sheet updated: 12<sup>th</sup> November 2002.

$$\Delta H^\circ = -93 \text{ kJ}\cdot\text{mol}^{-1}$$

## Rate coefficient data

$k/\text{cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$	Temp./K	Reference	Technique/ Comments
<i>Absolute Rate Coefficients</i>			
$2.1 \times 10^{-12} \exp[(570 \pm 140)/T]$ $(1.4 \pm 0.2) \times 10^{-11}$	228-354 298	Maricq and Szenté, 1996 <sup>1</sup>	PLP-AS (a)
$8.1 \times 10^{-12} \exp[(270 \pm 60)/T]$ $(2.0 \pm 0.3) \times 10^{-11}$	200-402 298	Villalta and Howard, 1996 <sup>2</sup>	F-CIMS (b)
$(2.0 \pm 0.3) \times 10^{-11}$	295	Sehested <i>et al.</i> , 1998 <sup>3</sup>	PR-A (c)
$6.0 \times 10^{-12} \exp[(320 \pm 40)/T]$ $(2.0 \pm 0.3) \times 10^{-11}$	218-370 296	Moise, Denzer and Rudich 1999 <sup>4</sup>	F-CIMS (d)
<i>Relative Rate Coefficients</i>			
$8.9 \times 10^{-12} \exp[(312 \pm 46)/T]$ (1 bar air)	247-298	Seefeld, Kinnison and Kerr, 1997 <sup>5</sup>	(e)
$(2.5 \pm 0.4) \times 10^{-11}$ (1 bar air)	298		
$(2.17 \pm 0.23) \times 10^{-11}$ (0.93 bar)	295	Sehested <i>et al.</i> , 1998 <sup>3</sup>	(f)

## Comments

- (a) Pulsed laser photolysis of  $\text{Cl}_2\text{-CH}_3\text{CHO-O}_2\text{-NO}$  mixtures at 351 nm. Time-resolved absorption spectroscopy using a gated diode array for  $\text{CH}_3\text{C}(\text{O})\text{O}_2$  in the UV and using a diode laser for NO and  $\text{NO}_2$  in the IR. Correction to  $k$  required for competing reactions of  $\text{CH}_3\text{C}(\text{O})\text{O}_2$ .
- (b)  $\text{CH}_3\text{C}(\text{O})\text{O}_2$  produced by thermal decomposition of peroxyacetyl nitrate and detected by CIMS through its reaction with  $\text{SF}_6^-$ .  $\text{NO}_2$ ,  $\text{CH}_3$  and  $\text{CO}_2$  were positively identified as products implying rapid decomposition of  $\text{CH}_3\text{C}(\text{O})\text{O}$  to  $\text{CH}_3$  and  $\text{CO}_2$ . Experiments conducted at pressures of 1.2 – 6 Torr (1.6 – 8 mbar) He.
- (c) Pulse radiolysis of  $\text{CH}_3\text{CHO-O}_2\text{-CO}_2\text{-NO}$  and  $\text{CH}_3\text{CHO-O}_2\text{-SF}_6\text{-NO}$  mixtures at 1 bar pressure. The rate coefficient was obtained from the formation of  $\text{NO}_2$ , measured by absorption at 400.5 nm.
- (d)  $\text{CH}_3\text{C}(\text{O})\text{O}_2$  produced by thermal decomposition of peroxyacetyl nitrate and detected by CIMS through its reaction with  $\text{SF}_6^-$ . Experiments conducted at 2-5 Torr (2.7 – 6.7 mbar) He.
- (e)  $\text{CH}_3\text{C}(\text{O})\text{O}_2$  produced by steady state photolysis of biacetyl in the presence of  $\text{O}_2$ . Yields of peroxyacetyl nitrate were measured as a function of the  $[\text{NO}]/[\text{NO}_2]$  ratio. Data gave  $k/k(\text{CH}_3\text{C}(\text{O})\text{O}_2 + \text{NO}_2) = 2.44 \pm 0.18$  at 1 bar, independent of temperature over the range 247 K to 298 K. The expression in the table is calculated using the recommended value for  $k(\text{CH}_3\text{C}(\text{O})\text{O}_2 + \text{NO}_2)$  at 1 bar pressure.<sup>6</sup>

- (f)  $\text{CH}_3\text{C}(\text{O})\text{O}_2$  radicals were produced by photolysis of  $\text{Cl}_2\text{-CH}_3\text{CHO-O}_2$  mixtures, and reactants and products monitored by FTIR spectroscopy. The measured rate coefficient ratio  $k(\text{CH}_3\text{C}(\text{O})\text{O}_2 + \text{NO}) / k(\text{CH}_3\text{C}(\text{O})\text{O}_2 + \text{NO}_2) = 2.07 \pm 0.21$  at 932 mbar  $\text{N}_2$  is placed on an absolute basis using the recommended value of  $k(\text{CH}_3\text{C}(\text{O})\text{O}_2 + \text{NO}_2)$ .<sup>6</sup>

### Preferred Values

$k = 2.0 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$  at 298 K.

$k = 7.5 \times 10^{-12} \exp(290/T) \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$  over the temperature range 200 K to 350 K.

#### Reliability

$\Delta \log k = \pm 0.15$  at 298 K.

$\Delta(E/R) = \pm 250 \text{ K}$ .

#### Comments on Preferred Values

The direct measurements at 298 K of Villalta and Howard<sup>2</sup>, Moise, Denzer and Rudich<sup>4</sup> and Sehested *et al.*<sup>3</sup> are in excellent agreement, all returning values of  $2 \times 10^{-11} \text{ cm}^3 \text{ molecule}^{-1} \text{ s}^{-1}$  and provide the basis of the 298 K recommendation. Those of Maricq and Szente<sup>1</sup> give a value of  $k(298)$  approximately 30% lower. Of the three temperature dependent data sets, those of Villalta and Howard<sup>2</sup> and Moise, Denzer and Rudich<sup>4</sup> agree within error limits and present a significantly weaker dependence than the more highly scattered data of Maricq and Szente.<sup>1</sup> The recommended temperature dependence was obtained by weighted least squares fitting to the data of Villalta and Howard<sup>2</sup> and Moise, Denzer and Rudich.<sup>4</sup>

The earlier data for  $k$ , obtained relative to  $k(\text{CH}_3\text{C}(\text{O})\text{O}_2 + \text{NO}_2)$ ,<sup>7-11</sup> are generally consistent with this recommendation.
